30 CPR-Adult, Child and Infant

Adult (over age 8); Child (ages 1 to 8); Infant (birth to 1 year)

1. Open the airway by tilting the head and lifting the chin. Loosely, before you test for breathing for no more than 10 seconds.
2. If no breathing, give 2 breaths over 1 second each.

3. Find your hand on the breastbone midway between the nipples for chest compressions. For an adult, put your second hand on top of the first and interlock the fingers. For a child, use 1 or both hands. For an infant, put your 2 middle fingers just below an imaginary line between the nipples.

4. Give 20 hard compressions hard and fast—1-1/2 to 2 inches deep in the depth of the chest in an infant or child) at a rate of 100 per min for a steady fast rate: "One, two, three..." Then give 2 breaths.

5. Continue cycles of 30 compressions and 2 breaths. If the victim looks inside the mouth when opening it to give breaths or you look inside the mouth when opening it to give breaths or you are too exhausted to continue.

6. Continue CPR until the victim begins to breathe on their own (see AED panel), professional help arrives, or you are too exhausted to continue.

Important: Only CPR is not enough. It is essential to use an AED with automatic resuscitation as soon as possible. CPR is most effective when used with an AED.
